Student Guide

WHAT IS THE CLA+?

The Collegiate Learning Assessment (CLA+) is a performance-based assessment that measures critical-thinking, problem-solving, analytic-reasoning, and writing skills.

The CLA+ uses a Performance Task and a series of selected-response questions to measure these higher-order skills. These skills are not only necessary for success in college; they are important for success in the workplace and other aspects of life outside the classroom. No prior knowledge of any particular field is necessary in order to perform well. While the CLA+ allows schools to benchmark how much progress their students have made relative to the progress of similar students at other colleges, it also provides useful feedback to individual test takers themselves.

The principal goal of the CLA+ is to provide an objective assessment about the critical-thinking skills student possess as they enter and exit college.

WHY DO STUDENTS TAKE THE CLA+?

The skills needed by today’s students are far greater than those required of students just a decade or so ago. Students can no longer rely solely on the collection and mastery of discipline-based information. Rather, they need to be able to analyze and evaluate information, solve problems, and communicate effectively to a variety of audiences. These skills are now required not only because of the speed of information, but also by the demands of society at large—including employers—to have an engaged citizenry.

Participation in the CLA+ can help you assess areas of strength in the set of higher order skills that are in demand, not just in the college classroom, but also by employers. This information can be shared with your institution or future employers to prove that you possess desirable skills such as critical-thinking, problem-solving, and written communication.

Your CLA+ report will compare you with other students across the country who are also taking the CLA+, and will also provide indicators regarding your level of mastery on the higher-order skills we measure. As an entering student, you can attain a solid read on your analytic and quantitative reasoning, problem-solving, and writing strengths, which will help you plan your initial courses in the first two years of college. Moreover, the student report is a credential that you send potential employers and/or graduate schools as you approach graduation.

WHY CLA+ IS IMPORTANT TO INSTITUTIONS?

Over 250 colleges and universities annually participate in the CLA+ to determine how, and by how much, they contribute to the development of their students’ higher-order skills. Collecting this information is one step in the process of improving teaching and learning practices. Participation in the CLA+ requires the cooperation of many members of an institution, including administrators, faculty, and students.

Students who participate in the CLA+ contribute to the results and data that inform their institution about its students’ learning. The more students that participate, the more an institution can adapt to its results. Institutions that participate in the CLA+ also help students by providing them with a credential to round out their overall portfolio of mastery.

Percentage Of Employers Who Believe That The Following Skills Should Be Increasingly Emphasized In Recent College Graduates:

- The Ability To Communicate Effectively: 89%
- Critical Thinking And Analytic Reasoning: 81%
- The Application Of Knowledge And Skills To Real World Settings: 79%
- Complex Problem Solving: 75%

SKILLS MEASURED BY CLA+

CRITICAL THINKING
PROBLEM SOLVING
ANALYTIC REASONING
EFFECTIVE COMMUNICATION
SCIENTIFIC REASONING
QUANTITATIVE REASONING
CRITICAL READING

If your institution isn't currently offering the CLA+, please let us know (clateam@cae.org). You may either be able to take the CLA+ on your own, or if enough of your peers are interested, we can reach out directly to your institution.
THE IMPORTANCE OF THE CLA+ FOR STUDENTS

It makes sense for you to take the CLA+ and try your best on an assessment that most students find interesting, even compelling. The Performance Task Document Library provides all the information you will need to solve an interesting problem and construct a response. Moreover, the CLA+ is the first assessment that is designed to be appropriate from college to the work place. This assessment therefore has important practical benefits for students about to graduate from community colleges or four year institutions. They now have an assessment that provides them with important information they can use beyond college transcripts to send prospective employers who highly prize the critical-thinking skills the CLA+ assesses.

Unlike the original CLA, which did not have any stakes attached to it for students who take the test, both students and colleges that utilize the CLA+ should understand the attached stakes as well as additional stakes colleges may consider using it for. CLA+ is not what is called a high-stakes test like the SAT or ACT which are used to help decide whether you will be admitted to a college. However, the addition of significant stakes means you should try your best on the CLA+. This should not be a hardship since many generations of student test takers report the CLA Performance Tasks to be engaging to respond to. Students learn how to improve their critical-thinking skills even as their skill levels are being assessed.

Because the CLA+ is reliable and valid for individual student test results as well as the institution-based value-added approach CLA focused on, this adds important uses. Students, their sponsoring college, and employers will be able to take advantage of results to improve student learning for individuals when they start college and as they transition to employment.

CLA+ will continue to feature the value-added approach which is designed to answer the important question, “How much value does the institution add to the growth in student learning over the course of the student’s career at the institution?” This information permits your professors and administrators to understand what to focus on to improve teaching and learning. However, the new protocol also provides these important new benefits.

First, if you are an entering freshman; you will receive certified results of your test scores. Your student report will provide you with a good sense of how your skills compare to all other students taking the CLA+. You will receive a solid read on your analytic and quantitative reasoning, problem-solving, and writing strengths and weaknesses which will help you plan your initial courses during the first two years of college. Moreover, the student report is a credential that you may use, at your choice, to send to potential employers you may wish to work part time for or receive an internship from. Institutional representatives, possibly including your professors, may also consult your CLA+ test results, at their discretion, for diagnostic purposes or course placement.

Second, and most importantly, because the critical-thinking skills CLA+ measures are seen by employers, as important requisites for success in the workplace, you will have the opportunity to take the CLA+ as a graduating senior and receive certified results. You may then choose to provide potential employers with these results in addition to your college transcript and other relevant information. Of course, most employers rely on interviews to make final decisions who to hire. As part of their hiring process they often ask applicants to take tests that measure skills of particular importance to their firm. Currently, however, there is no appropriate standardized test that students can take, add to their transcript, and send to prospective employers to assist them in prescreening applicants. The CLA+ is designed to fill this gap. As a graduating senior taking the CLA+ you will want to try your best on the CLA+ because your test results may assist you in gaining the kind of employment you deserve in an increasingly competitive job market.
PERFORMANCE TASKS

Each Performance Task assesses analysis and problem solving, writing effectiveness and writing mechanics by asking students to answer several open-ended questions about a hypothetical but realistic situation. Students have 60 minutes to complete a Performance Task.

A Performance Task also has its own Document Library that includes a range of information sources, such as letters, memos, photographs, charts, or newspaper articles.

To complete Performance Tasks, you may have to weigh different types of evidence, evaluate the credibility of various documents, spot possible bias, and identify questionable or critical assumptions. It is important to note that there is no single correct answer to a Performance Task.

Characteristics of a high quality Performance Task response:
- Evaluates whether evidence is credible or unreliable
- Provides analysis and synthesis of the evidence
- Draws conclusions that follow from the provided evidence
- Is well-organized and logically developed, with each idea building upon the last
- Shows strong command of writing mechanics and vocabulary

EXAMPLE PERFORMANCE TASK:

SCENARIO

Pat Stone is running for reelection as mayor of Jefferson, a city in the state of Columbia. Mayor Stone’s opponent in this contest is Dr. Jamie Eager. Dr. Eager is a member of the Jefferson City Council. You are a consultant to Mayor Stone. Dr. Eager made the following three arguments during a recent TV interview:

First, Mayor Stone's proposal for reducing crime by increasing the number of police officers is a bad idea. Dr. Eager said “it will only lead to more crime.” Dr. Eager supported this argument with a chart that shows that counties with a relatively large number of police officers per resident tend to have more crime than those with fewer officers per resident.

Second, Dr. Eager said “we should take the money that would have gone to hiring more police officers and spend it on the STRIVE drug treatment program.” Dr. Eager supported this argument by referring to a news release by the Washington Institute for Social Research that describes the effectiveness of the STRIVE drug treatment program. Dr. Eager also said there were other scientific studies that showed the STRIVE program was effective.

Third, Dr. Eager said that because of the strong correlation between drug use and crime in Jefferson, reducing the number of addicts would lower the city’s crime rate. To support this argument, Dr. Eager showed a chart that compared the percentage of drug addicts in a Jefferson zip code area to the number of crimes committed in that area. Dr. Eager based this chart on crime and community data tables that were provided by the Jefferson Police Department.

ROLE

You are a consultant to Mayor Stone

TASK

Mayor Stone has asked you to prepare a memo that analyzes the strengths and limitations of each of Dr. Eager’s three main points, including any holes in those arguments. Your memo also should contain your conclusions about each of Dr. Eager’s three points, explain the reasons for your conclusions, and justify those conclusions by referring to the specific documents, data, and statements on which your conclusions are based.

Fueling the Future

In a quest to solve the energy problems of the twenty-first century—that is, to find sustainable and renewable sources of energy that are less destructive to the environment yet economical enough to have mass appeal—scientists throughout the world are experimenting with innovative forms of fuel production. While oil is still the most common source of fuel, there is a finite amount of it, and new alternatives will become necessary to sustain the supply of energy that we are accustomed to.

Corn-based ethanol, the most common alternative to traditional fossil fuels (primarily coal, petroleum, and natural gas), is mixed into gasoline in small quantities, and it now accounts for about 10% of the fuel supply from sources within the United States. Because corn is grown on farmland it is subject to price fluctuations based on supply and demand of the crop, as well as disruptions resulting from naturally occurring events, such as droughts and floods. At present, nearly 40% of the corn grown in the United States is now used for fuel, and the demand for corn-based ethanol is rising. To meet this demand, wetlands, grasslands, and forests are all being converted into farmland with the sole intention of growing corn for more ethanol production. Corn grown for ethanol has become a more valuable commodity for farmers than crops grown for food, and this has negatively affected consumers worldwide, as shown by the increasing price of food over time.

Another alternative that has gained attention in recent years is the harvesting of biofuel from algae. Biodiesel, a type of biofuel, is produced by extracting oil from algae, much like the process involved in creating vegetable oils from corn or soybeans. Ethanol can also be created by fermenting algae.

Algae biofuel has some unique benefits that separate it from other fossil fuel alternatives. To begin with, while all fuels create carbon dioxide when they are burned, algae have the ability to recapture and use that carbon dioxide during photosynthesis while they are growing. In this regard, the advantage is enormous. The process of growing algae actually absorbs more carbon dioxide than is released into the atmosphere when it is burned for fuel. Most manufacturing processes strive for “carbon neutrality”—or the balance between carbon emissions and depletion corresponding to a net carbon output of zero. Even better, algae-based biofuel can be described as “carbon negative.”

Other forms of biofuel can make similar claims. For example, ethanol from corn also eliminates carbon dioxide in the atmosphere through photosynthesis. Unlike corn, however, algae grow in water, usually in man-made ponds built on land not used for crops. Additionally, algae do not require fresh water. Instead algae can be grown in salt water, and in some cases even sewage water and other waste material.

The most promising aspect of algae biofuel items from its yield. When compared to other biofuel producers, algae’s fuel yield per harvested acre is over 500 times greater than corn-based ethanol.

The following chart compares commonly used biofuel crops on several important factors.

Table 1: Comparison of biofuel crops (based on information found at: algaefuel.org and c1gas2.org/wpengine.netdna-cdn.com)

<table>
<thead>
<tr>
<th>Product</th>
<th>Oil Yield Gallons/Acre</th>
<th>Harmful Gas Emissions</th>
<th>Use of Water to Grow Crop</th>

</table>

**Which of the following negatively affects algae biofuel’s ability to be a “carbon-negative” energy source?**

A. It takes 3000 liters of water to create one liter of biofuel from algae, which is highly inefficient and wasteful of resources.
B. The process of extracting biofuel from algae requires more energy than is generated by burning the biofuel itself.
C. The construction of facilities needed to extract algae biofuel would initially require the use of fossil fuels for energy.
D. Algae biofuel is about 25 years away from being commercially viable, by which point there will be more efficient alternative energy sources.
